

IN THE CLAIMS

1. (Currently Amended) A method for controlling zoning within a device of a storage network, the method comprising the steps of:

receiving a generic zone control command that controls a configuration of zoning in the storage network;

translating the generic zone control command to at least one vendor specific device command of a plurality of vendor specific device commands that respectively control zoning in a plurality of different vendor devices; and

performing functions associated with the at least one vendor specific device command to control zoning in the device;

wherein the steps of receiving, translating and performing are executed by a management application operating in a management station computer system, the management application controlling zoning within switches by transmitting the at least one vendor specific device command over a network to a corresponding at least one vendor specific switch device after translation of the generic zone control command;

wherein the management application receives the generic zone control command and, in response, generates i) a corresponding first vendor specific command for transmission to a first vendor switch device type, and ii) a corresponding second vendor specific command for transmission to a second vendor switch device type; and

wherein both the first vendor specific command and the second vendor specific command pertain to a common zoning function supported by a first switch device and a second switch device to which the first vendor specific command and the second vendor specific command are transmitted.

2. (Original) The method of claim 1 wherein the step of translating includes the steps of:

identifying a vendor of at least one device within a zone corresponding to the generic zone control command; and

selecting a set of vendor specific device commands, from the plurality of vendor specific device commands that respectively control zoning in devices from different vendors, that corresponds to the vendor of at least one device within the zone.

3. (Original) The method of claim 2 wherein the step of selecting a set of vendor specific device commands selects the set of vendor specific device commands that are specific to a vendor of a device that exists within the zone to which the generic zone control command is directed.

4. (Original) The method of claim 2 wherein the step of identifying includes the steps of:

identifying devices within the zone that are affected by the generic zone control command; and

identifying vendors of the devices within the zone that are affected by the generic zone control command.

5. (Original) The method of claim 1 wherein:

the plurality of vendor specific device commands include sets of vendor specific device commands; and

wherein the step of translating includes the steps of:

selecting a set of vendor specific device commands that can control zoning within a device to which the generic zone control command is directed; and

dynamically loading the set of vendor specific device commands into a management application to allow the management application to control zoning within the device to which the generic zone control command is directed.

6. (Original) The method of claim 5 wherein the step of translating includes steps of:

selecting the at least one vendor specific device command, within the set of vendor specific device commands, that performs zoning operations, in the device to which the generic zone control command is directed, in accordance with the generic zone control command; and

mapping parameters of the generic zone control command to parameters of the at least one vendor specific device command to provide the vendor specific device command with data required to perform the zoning operations in the device.

7. (Original) The method of claim 5 wherein the set of vendor specific device commands is selected based on an identity of a vendor of the device to which the generic zone control command is directed.

8. (Original) The method of claim 1 wherein the step of receiving receives the generic zone control command from a device management application that can control zoning in a network of devices manufactured by different vendors.

9. (Original) The method of claim 1 wherein the step of performing performs the at least one vendor specific device command to control zoning within a device from a vendor that is a vendor of devices that are controlled by the vendor specific device command to which the generic zone control command is translated.

10. (Original) The method of claim 1 wherein the step of translating includes the steps of:

loading a library of vendor specific device commands into a management application based on an identity of a vendor of a device affected by the generic zone control command; and

calling the at least one vendor specific device command using the generic zone control command having the same format as the at least one vendor specific device command perform zoning operations within the device affected by the generic zone control command.

11. (Original) The method of claim 1 wherein the steps of receiving, translating and performing are processed by a management application that controls zoning within switches in a data storage network and wherein the step of translating includes a step of loading a dynamically linked library of vendor specific device commands, selected based on a vendor of a device affected by the generic zone control command, into a memory for use by the management application to control zoning in the device.

12. (Currently Amended) A computer system configured to control zoning in a plurality of devices from different vendors in a network, the computer system comprising:

an input-output interface;

a processor; and

a memory system coupled to the processor and to the input-output interface and encoded with instructions that form a multi-zone management application that, when performed on the processor, cause the computer system to:

receive, via the input-output interface, a generic zone control command;

translate the generic zone control command to at least one vendor specific device command of a plurality of vendor specific device commands that respectively control zoning in a plurality of different vendor devices coupled to the input-output interface; and

perform the at least one vendor device specific command to control zoning in a device coupled to the input-output interface;

wherein the instructions that control zoning within the device, when performed on the processor, cause the computer system to control which of multiple ports in the device shall be grouped together to form the zone through which servers are able to access a data storage system in a storage area network; and

wherein the instructions that control which of multiple ports in the device shall be grouped together to form the zone, when performed on the processor, cause the computer system to configure multiple server ports and multiple data storage ports of the device to be in the zone, the multiple server ports associated with the zone handling a transfer of data between a server and the device, the multiple data storage ports associated with the zone handling a transfer of data between the device and the data storage system.

13. (Original) The computer system of claim 12 further including:

a multi-zone command database containing the plurality of vendor specific device commands; and

wherein the multi-zone management application encoded within the memory system includes instructions that, when performed on the processor, cause the computer system to:

identify a vendor of at least one device within the zone corresponding to the generic zone control command;

select a set of vendor specific device commands, from the plurality of vendor specific device commands in the multi-zone command database, that corresponds to the vendor of at least one device within the zone; and

map the generic zone control command to at least one vendor specific device command within the set of vendor specific device commands.

-7-

14. (Original) The computer system of claim 13 wherein the instructions that select, when performed on the processor, cause the computer system to select the set of vendor specific device commands that are specific to a vendor of a device within the zone to which the generic zone control command is directed.

15. (Original) The computer system of claim 13 wherein the instructions that identify, when performed on the processor, cause of the computer system to:
 identify devices within the zone that are affected by the generic zone control command; and
 identify vendors of the devices within the zone that are affected by the generic zone control command.

16. (Original) The computer system of claim 12 wherein:
 the plurality of vendor specific device commands within the multi-zone command database include sets of vendor specific device commands; and
 wherein the instructions that translate, when performed on the processor, cause the computer system to:
 select a set of vendor specific device commands that can control zoning within a device to which the generic zone control command is directed; and
 dynamically load the set of vendor specific device commands into the memory system to allow the management application to control zoning within the device to which the generic zone control command is directed.

17. (Original) The computer system of claim 16, wherein the instructions that translate, when performed on the processor, cause the computer system to:
 select the at least one vendor specific device command, within the set of vendor specific device commands, that performs zoning operations, in the device

to which the generic zone control command is directed, in accordance with the generic zone control command; and

map parameters of the generic zone control command to parameters of the at least one vendor specific device command to provide the vendor specific device command with data required to perform the zoning operations in the device.

18. (Original) The computer system of claim 16 wherein the instructions that select the set of vendor specific device commands, when executed, cause the computer system to select the set of the vendor specific device commands based on an identity of a vendor of the device to which the generic zone control command is directed.

19. (Original) The computer system of claim 12 wherein the multi-zone management application is a device management application that can control zoning in a network of switches from different vendors, the network coupled to the input-output interface.

20. (Original) The computer system of claim 12 wherein the instructions that perform, when performed on the processor, cause the computer system to perform the at least one vendor specific device command to control zoning within a device from a vendor that is a vendor of devices that are controlled by the vendor specific device command to which the generic zone control command is mapped.

21. (Original) The computer system of claim 12 wherein the instructions that translate, when performed on the processor, cause the computer system to load a library of vendor specific device commands into a management application based on a vendor of a device affected by the generic zone control command to allow the management application to perform vendor specific device commands

in order to carry out the generic zone control command within the device affected by the generic zone control command.

22. (Original) The computer system of claim 12 wherein the instructions that translate, when performed on the processor, cause the computer system to load a dynamically linked library of vendor specific device commands, selected by a device identifier coupled to the memory system, based on a vendor of a device affected by the zoning control command, into the memory system for use by the management application to control zoning in the device.

23. (Original) The computer system of claim 12 wherein the memory system is encoded with at least one command mapping that indicates how the generic zone control command corresponds to the vendor specific device command for a specific vendor device, and wherein the instructions that translate use the command mapping to map the generic zone control command to a format required by the vendor device specific command within the vendor device specific command set.

30. (Canceled)

31. (Currently Amended) A method as in claim 1 ~~claim 30~~ further comprising:
identifying that there is no need to map the generic zone control command to corresponding at least one vendor specific device commands; and
utilizing the generic zone control command to carry out zone control operations.

32. (Previously Presented) A method as in claim 1 further comprising:
at a remote node over a network, generating i) a corresponding first vendor specific command, based on the generic zone control command, for transmission to a first switch device type, and ii) a corresponding second vendor specific command, based on the generic zone control command, for transmission to a second switch device type; and
from the remote node, transmitting i) the corresponding first vendor specific command to a switch device of the first switch device type, and ii) transmitting the corresponding second vendor specific command for transmission to a switch device of the second switch device type, to control zoning associated with hosts and corresponding data storage resources in a storage network.

33. (Canceled)

34. (Canceled)

35. (Canceled)

36. (Previously Presented) A method as in claim 1, wherein receiving the generic zone control command includes receiving a configuration command to configure a zone in the device to support access in a storage area network.

37. (Currently Amended) A method ~~as in claim 1,~~ for controlling zoning within a device of a storage network, the method comprising the steps of:

receiving a generic zone control command that controls a configuration of zoning in the storage network;

translating the generic zone control command to at least one vendor specific device command of a plurality of vendor specific device commands that respectively control zoning in a plurality of different vendor devices;

performing functions associated with the at least one vendor specific device command to control zoning in the device; and

wherein controlling zoning within the device includes controlling which of multiple ports in the device shall be grouped together to form the zone in the device through which servers are able to access a data storage system in a storage area network.

38. (Previously Presented) A method as in claim 37, wherein controlling which of multiple ports in the device shall be grouped together to form the zone includes configuring multiple server ports and multiple data storage ports of the device to be in the zone of the device, the multiple server ports associated with the zone handling a transfer of data between a server and the device, the multiple data storage ports associated with the zone handling a transfer of data between the device and the data storage system.

39. (Previously Presented) A method as in claim 38, wherein the device is a storage network switch; and

wherein steps of receiving, translating, and performing are executed in a network manager device that configures the zone associated with the device, the zone indicating which of multiple servers coupled to the device is capable of accessing selected portions of the data storage system.

-12-

40. (Previously Presented) A method as in claim 1 further comprising:
- identifying to which type of vendor device in a storage area network the generic zone control command pertains;
 - if the generic zone control command pertains to a first vendor type of device, forwarding the generic zone control command to the first vendor type of device; and
 - if the generic zone control command pertains to a second vendor type of device, translating the generic zone control command to a vendor specific zone control command associated with the second vendor type of switch and forwarding the vendor specific zone control command to the second vendor type of device.
41. (Previously Presented) A computer system as in claim 12, wherein the instructions that receive the generic zone command, when performed on the processor, cause the computer system to receive a configuration command to configure a zone in the device to support access to a storage area network.
42. (Canceled)
43. (Canceled)
44. (Currently Amended) A computer system as in ~~claim 43~~ claim 12, wherein the device is a storage network switch; and
- wherein the instructions that receive, translate, and perform are executed in a network manager device that configures the zone associated with the device, the zone indicating which of multiple servers coupled to the device is capable of accessing selected portions of the data storage system.

45. (Previously Presented) A computer system as in claim 12 further including instructions to support operations of:

identifying to which type of vendor device in a storage area network the generic zone control command pertains;

if the generic zone control command pertains to a first vendor type of device, forwarding the generic zone control command to the first vendor type of device; and

if the generic zone control command pertains to a second vendor type of device, translating the generic zone control command to a vendor specific zone control command associated with the second vendor type of switch and forwarding the vendor specific zone control command to the second vendor type of device.

46. (Currently Amended) A method ~~as in claim 1 further comprising:~~ for controlling zoning within a device of a storage network, the method comprising the steps of:

receiving a generic zone control command that controls a configuration of zoning in the storage network;

translating the generic zone control command to at least one vendor specific device command of a plurality of vendor specific device commands that respectively control zoning in a plurality of different vendor devices;

performing functions associated with the at least one vendor specific device command to control zoning in the device; and

executing steps of receiving, translating and performing in a management application operating in a management station computer system at a remote location with respect to the device to which the generic zone control command pertains, the device residing in a storage area network managed by the management application, the management application controlling a zoning configuration in the device by transmitting

the at least one vendor specific device command over a network to the device after translation of the generic zone control command into the at least one vendor specific command.

47. (Previously Presented) A method as in claim 46, wherein the management application receives the generic zone control command and, in response, generates and transmits i) a corresponding first vendor specific command for transmission to a first vendor device type in the storage area network based on translation of the generic zone control command, and ii) a corresponding second vendor specific command for transmission to a second vendor device type in the storage area network based on translation of the generic zone control command, both the first device type and the second device type implementing access control according to zone configuration settings as initiated by the generic zone control command.
48. (Previously Presented) A method as in claim 47, wherein both the first vendor specific command and the second vendor specific command pertain to a common zoning function supported by the first device type and the second device type to which the first vendor specific command and the second vendor specific command are respectively transmitted, the common zoning function providing access control for servers attempting to retrieve data from respective storage systems over a storage area network in which the first device type and the second device type reside.
49. (Currently Amended) A method ~~as in claim 1,~~ for controlling zoning within a device of a storage network, the method comprising the steps of:
receiving a generic zone control command that controls a
configuration of zoning in the storage network;

translating the generic zone control command to at least one vendor specific device command of a plurality of vendor specific device commands that respectively control zoning in a plurality of different vendor devices;

performing functions associated with the at least one vendor specific device command to control zoning in the device; and

wherein translating the generic zone control command includes:

in response to receipt of the generic zone control command at a management station of a storage area network that configures zoning in the storage area network at a remote location with respect to the plurality of different vendor devices that reside in the storage area network, identifying multiple zone management devices in the storage area network to which the generic zone control command pertains, the zone management devices being of at least two different vendor types, each of which understands a different set of zone configuration commands, the zone management devices enabling a host to retrieve data from a storage system in the storage area network;

identifying vendor types associated with the multiple zone management devices;

in response to identifying the vendor types associated with the multiple zone management devices, selecting respective sets of vendor specific device commands understood by respective vendor types of the zone management devices to which the generic zone control command pertains;

for each of the at least two different vendor types of zone management devices:

based on the respective sets of vendor specific device commands, determining whether the generic zone control command needs to be translated to a corresponding zone

-16-

configuration command understood by a respective vendor type of zone management device or whether the respective vendor type of device can interpret the generic zone configuration command and needs no translation;

if translation is required, mapping parameters of the generic zone control command to parameters of a respective vendor specific device command to be forwarded to the respective vendor type of zone management device for configuring its corresponding zone settings;

if no translation is required, initiating transmission of the generic zone control command to the respective vendor type of zone management device in order to configure corresponding zone settings of the respective vendor type of zone management device.
